

## Information

Many people do not know that they create health damaging problems by residential burning – even if they have an eco-labelled stove operating under optimal conditions. Information about pollution from residential burning is the way to cleaner air since most people do not want to pollute and will stop burning when informed about their pollution.

## Pollution from residential burning

Residential burning of wood, coal, lignite, coke and waste is one of the most health damaging pollution sources in the EU

### Pollution from residential burning in the EU:

- Causes 60,000 premature deaths and 60 million sick days every year
- Emits 150 times more soot particles than all power plants
- Can pollute your indoor air to health damaging levels

Reference: GAINS model, IIASA

If nothing is done the emission of toxic soft particles from residential burning will increase to almost 70% of the total emission in the EU in 2030.

## **Healthier alternatives**

alternatives to traditional residential  
burning: Better insulation, new windows,

in the country side. Thereby particle emissions can be reduced by more than 90 %. Artificial „wood“ stoves with gases or electricity as fuel emit almost no particles and allow people to enjoy the cosy atmosphere connected to the flames. However, conventional gas still contributes to global warming.

in the country side. Thereby particle heat pumps or wood pellet boilers emissions can be reduced by more than 90 %. <b>Particulate emissions (<math>\text{PM}_{2.5}</math>) from heat sources</b>	(Danish emission factors; g particles pr. GJ energy)
2015 soot particle emissions in EU	It is well known that particle pollution increases the risk of heart disease
(273,000 tons)	(273,000 tons)
<b>Health damage</b>	

Health damage	It is well known that particle pollution increases the risk of heart diseases, thrombosis, serious airway diseases, cancer and thereby premature death.
2015 soot particle emissions in EU (273,000 tons)	pollution increases the risk of heart diseases, thrombosis, serious airway diseases, cancer and thereby premature death.
(mainly) residential buildings	Residential buildings cause 60,000 premature deaths every year in the EU. In many countries, cancer and thereby premature death, residential buildings cause 60,000 premature deaths every year in the EU. In many countries, cancer and thereby premature death.
Residential buildings 2030 soot particle emissions in EU (161,580 tons)	Residential buildings cause 60,000 premature deaths every year in the EU. In many countries, cancer and thereby premature death.

**Climate damage**

Some people believe that residential wood burning is „good“ for the climate. That is wrong. Wood burned as logs in small stoves and chimneys causes huge costs on society. Residential soot particles increase morbidity.

(161,580 tons) emissions in EU (2030 soot particle

An electrical fireplace provides the same cosy atmosphere without any local pollution

A close-up photograph of a fire burning in a fireplace. The flames are bright orange and yellow, dancing between logs. A red circle is overlaid on the bottom left corner of the image, containing the word "pollution".

The cosy atmosphere created by the flames is pleasant but the related health effects are very unpleasant

Particulate emission from different heat sources. For comparison is shown the emission from an older truck. For boilers are shown emissions with and without accumulation tank (acc., tank). The emission from district heating and heat pumps includes the emission from power plants (PP).

A horizontal bar chart comparing the number of households using various types of wood stoves in 1990 (left) and 2004 (right). The y-axis lists the stove types, and the x-axis shows the count of households from 0 to 1000.

Type	1990 (←)	2004 (→)
Old wood stove	930	0
Newer wood stove	740	270
Eco-label stove	0	155
New eco-label stove	0	2004 → 155
Old wood boiler	900	0
New wood boiler	413	206
Wood pellet boiler	29	0
Heat pump	1	1.3 (incl. PP)
District heating (incl. PP)	0	5.5 (Oil boiler)
Gas boiler 0.05	0	2006 → 5.5 (Without filter 5.5)

smoke and air pollution from wood burning. Even a weak smell typically indicates 5-10 times more air pollution than places without smell in the area. Whereas a heavy smell can indicate more than 50 times increased pollution levels. Air pollution in residential areas can thereby reach same pollution levels as the most polluted streets during rush hour. Use your nose and report to the environmental authorities if you smell smoke in your neighborhood.

**Particulate pollution** from stoves can directly leak damaging air pollutants into your living room. Areas to health damaging levels and stoves can indirectly leak damaging air pollutants ambient air in residential pollution. Residential burning often pollutes but still cause significant air pollution. Hence, new filter (energy unit). Hence, new eco-label stoves pollute less than old stoves but still cause significant air pollution. Residential burning often pollutes ambient air in residential pollution.

Toxic pollutants Residential burning in small stoves and boilers is a dominating source of many toxic air pollutants: Fine particles, soot particles, dioxins, tar compounds and volatile organic compounds. Particles are the main cause of morbidity and premature mortality pounds. Particles are the main cause of morbidity and premature mortality related to air pollution. Residential burning (mainly wood) causes more than half of the total soot particle emission in the EU.
